Alabama State Department of Education, Dr. Eric G. Mackey, State Superintendent of Education

The Alabama State Board of Education and the Alabama State Department of Education do not discriminate on the basis of race, color, disability, sex, religion, national origin, or age in its programs, activities, or employment and provide equal access to the Boy Scouts and other designated youth groups. The following person is responsible for handling inquiries regarding the non-discrimination policies: Title IX Coordinator, Alabama State Department of Education, P.O. Box 302101, Montgomery, AL 36130- 2101, telephone (334) 242-8165.

Revised: November 2018
Aquaculture CDE

Aquaculture Career Development Event

Purpose

The Aquaculture Career Development Event allows students to compete in various activities involved in the aquaculture industry. Aquaculture is one of the fastest growing sectors of agriculture. Through this event students will have an opportunity to participate in completing tasks integral to most aquaculture operations. The aquaculture CDE consists of several tasks completed on a daily basis at aquaculture farms. Tasks include water quality testing, weighing fish and determining feed amounts, basic plumbing, identification of common species and also a written exam covering basic principles. This career development event is a prime example of the growing diversity in agriculture. Each FFA Chapter is eligible to have one team of four dues paid FFA members competing. Teams will report directly to the state event. There will be no elimination at the county or district level.

Eligibility and Regulations

Each FFA Chapter is eligible to have one team of four dues paid FFA members competing. All four team member's scores will be counted due to the involvement of team activities. Teams will report directly to the state event. There will be no elimination at the county or district level.

Alternate Policy

For district level events, if a chapter brings alternates there will be no more than two alternates allowed per team. Alternates will use a copy of the scan form (not an original) for those events scored via judgingcard.com. If more than four official scan forms are turned in for a chapter in one event, the highest score(s) for that team will be disqualified and deleted until the chapter only has four team members in the scoring system. Alternates must not be in groups with official team members.

For state level events, alternates are not allowed

State Awards/Sponsor(s)

Refer to Alabama FFA Contests and Awards Booklet at:

http://www.alabamaffa.org/forms_applications.htm

State Event Scoring Procedures and Format

Event Phases	Total Possible Team Points	Percentage of total score
Written Exam	100 (x4)	20%
Species Identification	600 (x1)	30%
Fish Anatomy	50 (x4)	10%
Plumbing	50 (x4)	10%
Flow Rates	50 (x4)	10%
Solution Concentrations	50 (x4)	10%
Feed Ratio	50 (x4)	10%
	2,000	100%
(x#) indicates number of scores counted per chapter team		

1. **Written Exam:** A 50-question exam will be administered individually to every participant at the event. 50 minutes will be allowed for the written exam. Each question is worth 2 points (50 questions at 2 points each equals 100 total possible points for this event phase). Follow the link provided below to a list of modules that can be used as study materials for this exam. Related resources that pertain to the course of study content standards in aqua experience, aquaculture science, and aquatic biology can also be used as references.
 - http://www.aces.edu/dept/fisheries/education/NationalCouncilforAgricultureEducation_AquacultureCurriculumGuide.php
 - <https://srac.tamu.edu/index.cfm/event/getFactSheet/whichfactsheet/262/>

2. **Species Identification:** This is a team event in which participants will be tested on 40 species that are selected randomly from a list of 60 species that are provided in this handbook. 40 minutes will be allowed for species identification. Team members will identify the selected species by common name, scientific name, and identify if it lives in freshwater, brackish water, or salt water. At the state contest a word bank will be provided for the scientific names only. The correct common name, scientific name, and habitat will count 5 points each (40 species with 3 classification criteria at 5 points each equals 600 total possible points for this event phase). The species may be shown as photographs, live specimens, or preserved specimens.

3. **Fish Anatomy Identification:** This is an individual event where each participant must identify the external and internal anatomy of a fish. This may be done by filling in a diagram or by identifying labels on an actual specimen. See the attached diagram as a reference.

4. **Practicum Tests:** All materials that are needed will be furnished. Additional practicum tests may be used for future competitions. This year's practicum tests will consist of the following:
 - **Plumbing and Flow Rates:** This is a 2-person team event where 1 hour will be given for the completion of this practicum. Participants will manufacture and assemble a water control manifold system. Each chapter's team must build 2 separate manifolds by 2 distinct pairs of team members. This means that members from each team will be responsible for building one manifold per pair and cannot assist the other pair of teammates whatsoever. Therefore, each pair's manifold will be graded, which results in 2 scores per chapter. Also, each manifold will have 2 valves that the participants must measure and set to an assigned flow rate. Each valve on the manifold will have a different flow rate that must be achieved. At the state contest the manifold will be hooked up to a water pump. However, the same results can be reached by hooking the system up to an ordinary garden hose. In this practicum each paired team will be graded on the construction of their manifold as well as the precision of acquiring the desired flow rates which results in 4 total scores per chapter team (1 manifold construction score and 1 flow rate score per pair). Paired members will receive the same score for their shared activity. For more information see the attached worksheet for further instructions.

 - **Solution Concentrations:** This is an individual event where 30 minutes will be given for the completion of this practicum. Each participant will calculate appropriate solution concentrations for multiple tanks based on the volume of the system to determine the amount of additive needed.

This includes that participants be able to calculate the volume of a tank in cubic inches, convert that to gallons/liters, and therefore determine the amount of additive that is needed to reach the target alkalinity. See attached worksheet for further instructions and all formulas that will be needed.

- **Feed Ratio:** This is an individual event where 30 minutes will be given for the completion of this practicum. Given multiple scenarios about various tanks, each participant will determine the appropriate feeding amount based on a given percentage of total biomass that is to be fed. See attached worksheet for further instructions.

Tiebreakers

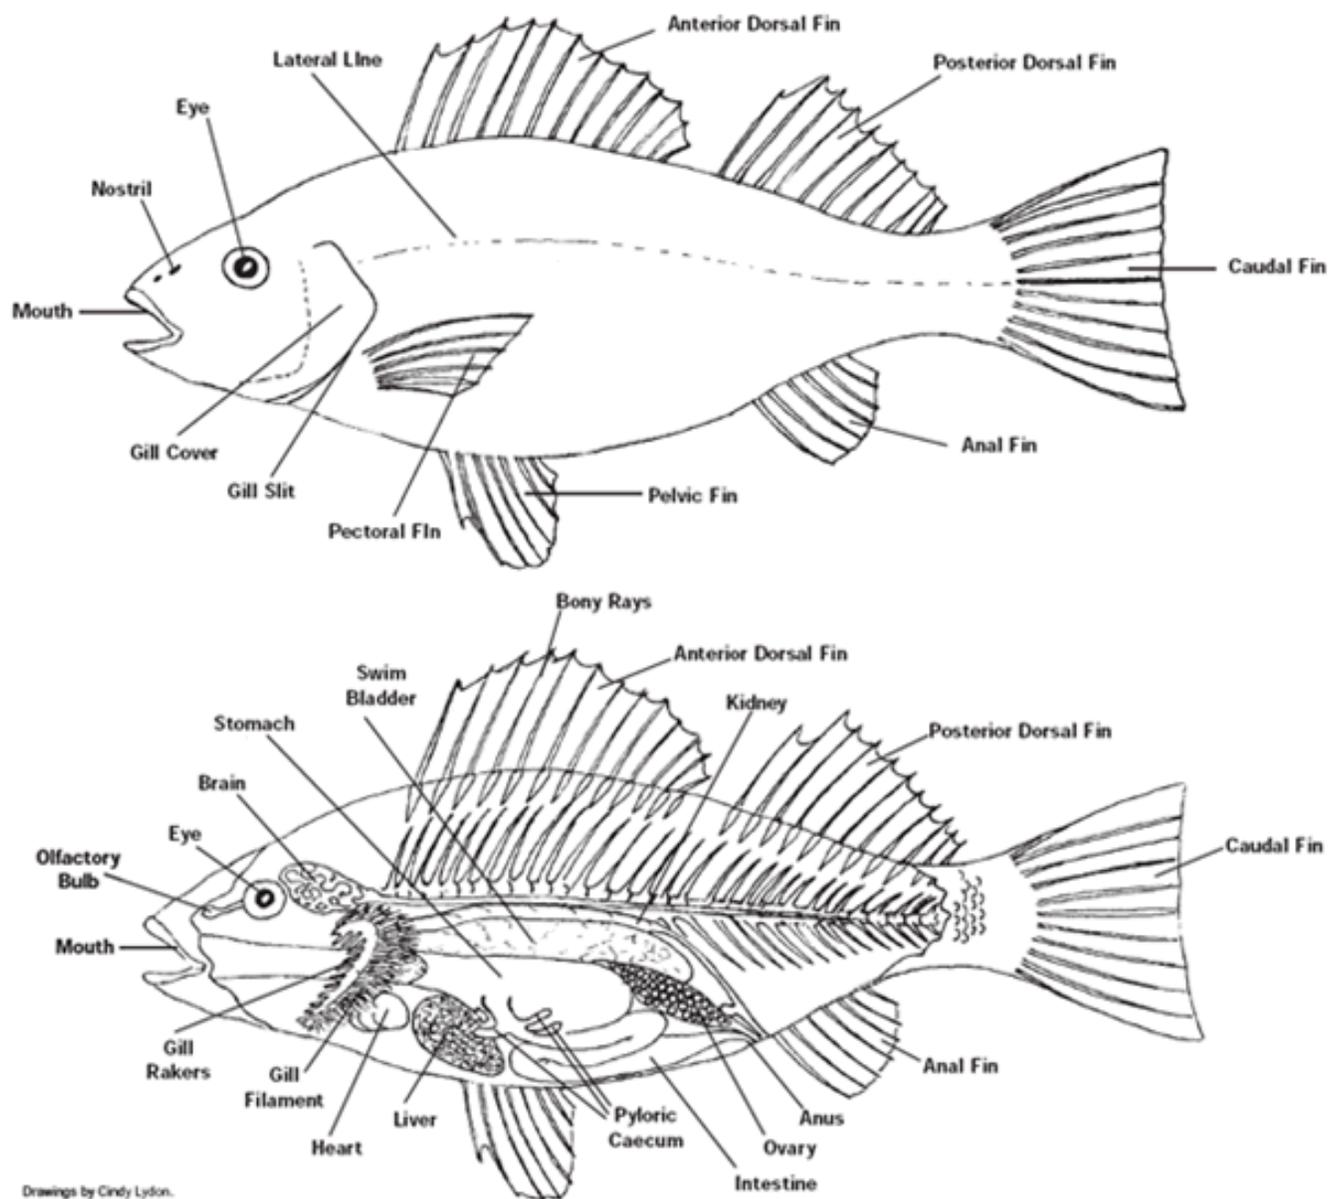

If a tie occurs, the following circumstances will be used in order to determine award recipients:

1. Highest total of practicum scores.
2. Highest total of species identification scores.
3. Highest total of written examination scores.
4. Highest individual score on written examination.

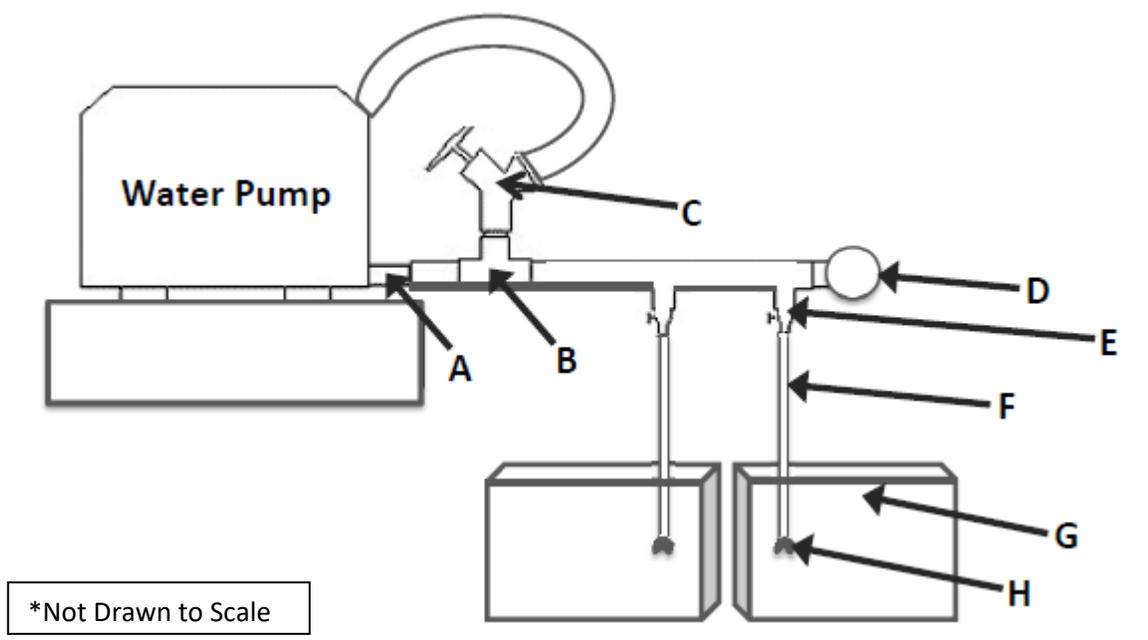

Event Rules

1. The team will consist of a maximum of four members. The team's total score will be based on the sum of the points earned by all (4) participants on the team.
2. All materials needed for this event will be furnished.
3. If a cell phone is seen or heard in the possession of a competitor, that individual student will be disqualified from competition and receive a score of zero.
4. Competitors must enter their name on the scorecard or they will receive a score of zero. Judges will not attempt to figure out who the card belongs to.
5. All individual safety equipment will be furnished by the participant for the state event. Safety glasses and closed toe shoes will be required at all times during the plumbing construction phase. Participants who are violating general safety rules will be dismissed from the event.

Fish Anatomy

Plumbing and Flow Rates

Manifold Materials:

A = $\frac{3}{4}$ in PVC pipe that already exists and is where the main manifold pipe (1 in PVC) will be attached

B = T-joint that continues the main manifold pipe (glued) and connects to "C" (pre-threaded)

C = Main pressure release valve that attaches to a hose that re-circulates water back into the reservoir

D = Water pressure gauge

E = Outlet valves that must be individually drilled, tapped and threaded into the 1 in main PVC pipe

F = Outlet hose which must produce a certain flow rate (2 hoses, 2 different flow rates)

G = Calibrated container where water volume can be measured

H = Water emitter that steadily regulates water flow for a more consistent flow rate

Grading Criteria per Manifold:

Plumbing: 200 total points per chapter

Pipes cut to length = 15 points

Valve placement = 15 points

No leaks = 30 points

Overall assembly = 40 points

Total = 100 points per manifold (a pair's total plumbing score divided by 2 is the individual's plumbing score)

2 manifolds per chapter = 200 points possible

*Lengths will be assigned for distances between all valves/gauges and fittings.

Flow Rate: 200 total points per chapter

Flow rate accuracy of outlet valve = 50 points each valve

2 valves per manifold = 100 points (a pair's total flow rate score divided by 2 is the individual's flow rate score)

2 manifolds per chapter = 200 points possible

Solution Concentrations

Formulas for Finding Volume:

Rectangular Tank: Length x Width x Height = Volume

Hexagonal Tank: (Base x Height x Length x .5) x 6 = Volume *Height is half of the tanks width

Octagonal Tank: (Base x Height x Length x .5) x 8 = Volume *Height is half of the tanks width

Cylindrical Tank: π x Radius² x Height = Volume *Radius is half of the tanks width

Oval Tank: (π x WidthA x WidthB x Height) / 4 = Volume *A = Minor Axis B = Major Axis

*if all measurements are made in inches the volume will be in cubic inches

Conversions Needed:

231 in³ = 1 gallon

1 gallon = 3.8 liters

1 ppm = 1 mg/L

***all formulas and conversions must be memorized and will NOT be given**

***all calculations MUST be rounded to the nearest tenth**

Example Problem:

If a rectangular tank that measures 24 inch x 18 inch x 16 inch has an alkalinity of 50 ppm and a desired alkalinity of 85 ppm, what is the amount of sodium bicarbonate that needs to be added to reach the target alkalinity?

(24 in x 18 in x 16 in) = 6,912 in³

6,912 in³ ÷ 231 in³/gallon = 29.9 gallons

29.9 gallons x 3.8 L = 113.6 liters

85 ppm – 50 ppm = 35 ppm

35 ppm = 35 mg/L

113.6 L x 35 mg/L = **3,976 mg** of sodium bicarbonate is needed to reach the target alkalinity

Feed Ratio

DIRECTIONS:

In this activity, you will weigh fish and determine biomass in order to formulate a proper feed ration. Because feed is a high cost, it is important not to overfeed. Fish have a tendency to gorge themselves when overfed, causing a fatty fish and contributing to off flavors when eaten. Additionally, underfeeding will increase the length of production time. Care must be taken to produce a quality product with minimum costs.

STEPS:

STEP 1 - Fill a one gallon bucket about half way with water and weigh it using the scales provided.

STEP 2 - Carefully remove 3 fish from a tank and place them in the bucket and record the new weight.

STEP 3 - Return fish to water.

STEP 4 - Plug numbers into formula and determine how much feed is needed per day.

FORMULA TO USE:

$$.025 \times ((A + B + C) \div 3) \times N = F$$

*.025 = the percentage of biomass we feed (2.5%).

*A + B + C = each individual weight of the fish.

*Divide A+B+C by 3 (number of fish weighed) for the average weight per fish in the tank.

*N = the total number of fish in the tank.

*F = the amount of feed needed per day.

NOTE: This formula must be memorized prior to event.

*Students can also be asked to calculate growth rates as well as grow out periods in relation to the feed ratio and weights of fish.

Species Identification List

	Common Name	Scientific Name	Fresh Water	Brackish Water	Salt Water
1	Common Carp	<i>Cyprinus carpio</i>	X		
2	Grass Carp	<i>Ctenopharyngodon idellus</i>	X		
3	Silver Carp	<i>Hypophthalmichthys molitrix</i>	X		
4	Golden Shiner	<i>Notemigonus crysoleucas</i>	X		
5	Channel Catfish	<i>Ictalurus punctatus</i>	X		
6	Blue Catfish	<i>Ictalurus furcatus</i>	X		
7	Flathead Catfish	<i>Pylodictis olivaris</i>	X		
8	Brown Bullhead Catfish	<i>Ameiurus nebulosus</i>	X		
9	Spotted Bullhead Catfish	<i>Ameiurus serracanthus</i>	X		
10	Alligator Gar	<i>Atractosteus spatula</i>	X		
11	Longnose Gar	<i>Lepisosteus osseus</i>	X		
12	Spotted Gar	<i>Lepisosteus oculatus</i>	X		
13	Rainbow Trout	<i>Oncorhynchus mykiss</i>	X	X	X
14	Brook Trout	<i>Salvelinus fontinalis</i>	X	X	X
15	Alabama Shad	<i>Alosa alabamae</i>	X	X	X
